Simon Myhre

Mandatory assignment 3

Task 7 – Update plan

Task 2 to 6 works basically as I intended. Everything works around my 1d array, that I now think should have been 2d. But, I think it worked out well. In task 2 I made a function that would read the csv file. It worked as intended. Then it sends the script to other functions.

The difficult part was to make a table with the array. I always had a way to do it. The problem was to get the most compact and elegant solution. Using appendChild was an option. But at the end I chose to just put everything into a string. Then innerHTML it to an output div. Worked well.

All the calculation did I save in an additional array. That is just a safe way to store some data. This data could I use in task 6 with no problems.

I always new how to get the elements. Its always 4 columns. That means the same data will be +4 in the array. But it would look cleaner if I had used 2d. Then everything in that specific date would be in the same "row".

I misunderstood task 8 and 9. Now I see I wound be pushing any element into the array, but finding specific (relevant) things about it.
